Dr. Bruce Blazar is a Professor of Pediatrics in the Division of Blood and Marrow Transplantation and serves as Chair of the National Institutes of Health Cancer Immunopathology and Immunotherapy Study Section and as a member of several national committees. He has been recognized for his pioneering work in the development of novel immune-based therapies.

Dr. Blazar’s research involves the immunobiology of transplantation and is focused in five areas:

- **Graft-versus-host Disease:** Studies are directed toward identifying and modifying signals that drive or inhibit acute and chronic GVHD generation.
- **Regulatory T Cells:** Approaches have been developed to propagate and expand CD4+25+ T regulatory cells that can suppress alloresponses and GVHD.
- **Immune Post-transplant:** Developing approaches to protect the thymic epithelial cells (TEC) against injury.
- **Graft-versus-leukemia**
- **Gene therapy/repair:** Using molecular strategies to correct congenital disorders as an alternative to transplantation.
