

Autonomous wheel loader control system

A new control system architecture to automate the control of a wheel loader.

IP Status: Provisional Patent Application Filed

Applications

- Control of an automated wheel loader or other off-road vehicle

Technology Overview

Currently, a human driver controls both the drive and work functions of a wheel loader, which often results in high fuel consumption or low productivity. Researchers at the University of Minnesota have developed a new control system architecture for automated wheel loaders. This technology ensures autonomous operation of the engine in providing the required power for both the drivetrain and work circuit in real-time. By systematically coordinating the drive and work functions, the control system can provide more than 20% energy benefits while maintaining productivity.

Phase of Development

TRL: 5-6

Simulation is completed. Hardware-in-the-loop test is being carried out.

Desired Partnerships

This technology is now available for:

- License
- Sponsored research
- Co-development

Please contact our office to share your business' needs and learn more.

Researchers

- [Zongxuan Sun, PhD](#) Frank Rowley Professor, Department of Mechanical Engineering
