# Immortalized clonal human fibroblast line "F007"

Immortalized human fibroblast cell line obtained from a healthy individual

# **Applications**

- Wound healing and skin regeneration
- Tissue engineering
- Skin therapy

#### **Technology Overview**

Immortalized human fibroblast cell line from primary fibroblasts obtained from the muscle biopsy of a healthy individual. The cells were immortalized by overexpressing hTERT, CCND1 and a mutant CDK4, using two vectors pLV-hTERT-IRES-hygro and pbabe-cyclinD1+CDK4R24C from Addgene. These cells can grow indefinitely and can be differentiated into fat cells in vitro, by changing the medium to adipogenic differentiation medium.

#### **Technical Information**

**Organism:** Homo sapiens (human)

**Tissue:** Skeletal Muscle **Disease:** Normal

**Karyotype:** 46XX [20/20 normal metaphase spreads]

**Product format:** Frozen

#### **Desired Partnerships**

This cell line is fully developed and available for license. Please contact our office to learn more

### Researchers

- Michael Kyba, PhD Professor, Department of Pediatrics
- Darko Bosnakovski, PhD Assistant Professor, Department of Pediatrics
