# Multimodal Synchronization, Sound & Electrical Stimulation, Hearing Aid (mSynchear)

IP Status: Issued US Patent; Application #: 15/616,278

#### **Enhanced, Noninvasive Treatment of Hearing Disorders**

The technology is a hearing aid device with an integrated electrical stimulator to use for enhanced hearing rehabilitation. Electrodes are attached to different parts of the ear to provide precisely-timed electrical stimulations relative to acoustic signals transmitted from the hearing aid. Application of synchronized acoustic and electrical stimulation is used to suppress or enhance activity in the auditory system. The suppression of neural activity can be used for the treatment of hearing conditions such as Tinnitus and hyperacusis. This device can also be used to enhance hearing aid effectiveness.

## **Multimodal Stimulation for Auditory Neural Activity Correction**

Combining electrical stimulation of the ear region with precise timing relative to the sound input can alter activity in the auditory system. Based on the nature and time of electrical stimuli, the activity in the auditory system can either be enhanced or suppressed. The device features the ability to modify these signal parameters in real-time, enabling the user to change the sensitivity towards certain sound signals on the go. This multimodal synchronization therapeutic device can be used to enhance hearing rehabilitation, balance hearing across different energy ranges, and suppress other hearing ailments. The device features a wireless module that can be used to power and control the device remotely.

### **Phase of Development**

Proof of concept tested in animals.

# Benefits

- Enhanced hearing rehabilitation quicker recovery
- Non-invasive; no surgical implants needed
- Can be used as normal hearing-aid
- Minimal modification from a typical hearing-aid
- Wireless: no dangling wires/attachments
- Simple plug and use

#### **Features**

- Electrical stimulator for multiple ear regions
- Enhancement and suppression of neural activity from a single device
- Real-time modification to change sensitivity
- Wireless powering and communication with hearing aid

### **Applications**

## **Technology ID**

20160094

### Category

Engineering & Physical

Scientific reports 5 (2015): 9462

### **Ready for Licensing**

This technology is now available for license! The university is excited to partner with industry to see this innovation reach its potential. Please contact us to share your business' needs and your licensing interests in this technology. The license is for the sale, manufacture or use of products claimed by the patents.
